**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

### Office Action Summary

**Application No.**

10/519,432

**Applicant(s)**

KAASGAARD ET AL.

**Examiner**

TIFFANY M. GOUGH

**Art Unit**

1657

**Period for Reply** -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 30 April 2008.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 14-33 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 14-33 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SF/ICE)  
Paper No(s)/Mail Date \_\_\_\_\_

- 6) ☐ Other: \_\_\_\_\_

## **DETAILED ACTION**

### ***Continued Examination Under 37 CFR 1.114***

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 4/30/2008 has been entered. Claims 14-33 are pending and have been considered on the merits. Applicant's 1.132 Declaration filed 4/30/2008 has been received, entered and considered.

### ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 14-23,25,26,29,33 are rejected under 35 U.S.C. 102(e) as being anticipated by Kaasgaard et al (US2004/0175812A1).

The applied reference has a common inventor with the instant application. Based upon the earlier effective U.S. filing date of the reference, it constitutes prior art under 35 U.S.C. 102(e). This rejection under 35 U.S.C. 102(e) might be overcome either by a showing under 37 CFR 1.132 that any invention disclosed but not claimed in the reference was derived from the inventor of this application and is thus not the invention "by another," or by an appropriate showing under 37 CFR 1.131.

Applicant claims a method for fermenting a bacterium, specifically *Bacillus* sp., producing an enzyme of interest, specifically a hydrolase, in a culture medium of at least 50 liters comprising adding one or more compounds in the amount of at least 0.1%(w/w) selected from 1,2-propandiol, 1,3-propandiol, ethylene glycol, trehalose, xylitol, arabitol, dulcitol, mannitol, erythritol, cellobiose, sorbitol and a polyether having an average molecular weight less than 1000, either before and/or during fermentation. Applicant also claims addition of a salt to the medium, such as a chloride, sulphate, phosphate, nitrate, and ammonium salt. The enzyme of interest, a hydrolase, is recovered after removal of the bacterium.

Kaasgaard et al teach a method of recovering a protein of interest by the addition of compounds, specifically polyols and carbohydrates including, trehalose, xylitol, erythritol, sorbitol, monopropylene glycol, i.e. 1,2-propanediol to a bacterial fermentation medium during fermentation wherein an enzyme of interest is recovered (see abstract, 0007-0009, 0051-0057, 0080-0096, claims 1-18) after the removal of the bacterium. They disclose the bacteria to be of the *Bacillus* genus and the enzyme to be a hydrolase (see 0007-0022). They also teach the addition of salts such as chloride,

Art Unit: 1657

sulphate, phosphate, nitrate, and ammonium salt (see 0106-0108). The polyol is added in an amount of at least 0.1%(w/w) of medium (see 0093).

Although, Kaasgaard do not specifically disclose 1,2 and 1,3 propandiol, they do disclose monopropylene glycols. Propylene glycols, such as 1,2 propandiol are known in the art to be the collective name for monopropylene glycols, thus, 1,2 and 1,3 propandiols would inherently be covered by the term monopropylene glycol.

**Applicant's arguments and Declaration filed 4/30/2008 have been fully considered but they are not persuasive.** Applicant argues that Kaasgard '812 does not anticipate the claimed invention because '812 does not teach adding one or more polyols to a culture medium before and/or during fermentation. Applicant's arguments are not persuasive because, while it is noted that '812 teaches recovering a protein of interest from a fermentation broth (0044), they do however teach adding a polyol to a culture solution **prior to the recovery step**, i.e. during fermentation (0007,0009,0043-0053,0070). Clearly, if the art is teaching recovering a protein of interest from a fermentation broth prior to the recovery step, the addition of polyols before the recovery step can only be occurring during fermentation. Applicant even states in the arguments, p.6 first paragraph, that "One of ordinary skill in the art of making enzymes would understand that fermentation occurs before the recovery of enzyme."

Therefore, the reference anticipates the claimed subject matter.

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 14-33 are rejected under 35 U.S.C. 103(a) as being obvious over Kaasgaard et al. (US2004/0175812A1).

The applied reference has a common inventor with the instant application. Based upon the earlier effective U.S. filing date of the reference, it constitutes prior art only under 35 U.S.C. 102(e). This rejection under 35 U.S.C. 103(a) might be overcome by: (1) a showing under 37 CFR 1.132 that any invention disclosed but not claimed in the reference was derived from the inventor of this application and is thus not an invention "by another"; (2) a showing of a date of invention for the claimed subject matter of the application which corresponds to subject matter disclosed but not claimed

in the reference, prior to the effective U.S. filing date of the reference under 37 CFR 1.131; or (3) an oath or declaration under 37 CFR 1.130 stating that the application and reference are currently owned by the same party and that the inventor named in the application is the prior inventor under 35 U.S.C. 104, together with a terminal disclaimer in accordance with 37 CFR 1.321(c). This rejection might also be overcome by showing that the reference is disqualified under 35 U.S.C. 103(c) as prior art in a rejection under 35 U.S.C. 103(a). See MPEP § 706.02(l)(1) and § 706.02(l)(2).

Applicant claims a method for fermenting a bacterium, specifically *Bacillus* sp., producing an enzyme of interest, specifically a hydrolase, in a culture medium of at least 50 liters comprising adding one or more compounds in the amount of at least 0.1%(w/w) selected from 1,2-propandiol, 1,3-propandiol, ethylene glycol, trehalose, xylitol, arabitol, dulcitol, mannitol, erythritol, cellobiose, sorbitol and a polyether having an average molecular weight less than 1000, either before and/or during fermentation. Applicant also claims addition of a salt to the medium, such as a chloride, sulphate, phosphate, nitrate, and ammonium salt. The enzyme of interest, a hydrolase, is recovered after removal of the bacterium.

Kaasgaard et al teach a method of recovering a protein of interest by the addition of compounds, specifically polyols and carbohydrates including, trehalose, xylitol, erythritol, sorbitol, monpropylene glycol, i.e. 1,2-propanediol to a bacterial fermentation medium during fermentation wherein an enzyme of interest is recovered (see abstract, 0007-0009, 0051-0057, 0080-0096, claims 1-18) after the removal of the bacterium. They disclose the bacteria to be of the *Bacillus* genus and the enzyme to be

Art Unit: 1657

a hydrolase (see 0007-0022). They also teach the addition of salts such as chloride, sulphate, phosphate, nitrate, and ammonium salt (see 0106-0108). The polyol is added in an amount of at least 0.1%(w/w) of medium (see 0093).

Kaasgaard et al do not teach each and every compound, specifically, 1,2 and 1,3-propanediol, arabitol, dulcitol and polyethers with a MW less than 1000. However,

they do teach any polyol having the formula  $C_nH_{2n+2}O_m$  and/or a carbohydrate.

Thus, the compounds claimed fall within this formula, thus, all the claimed polyols and carbohydrates would be obvious to one of ordinary skill in the art to be added to a fermentation solution to recover an enzyme of interest. Further, as stated in the above 102(e) rejection, propylene glycols, such as 1,2 propandiol are known in the art to be the collective name for monopropylene glycols, thus, 1,2 and 1,3 propandiols would inherently be covered by the term monopropylene glycol.

**Applicant's arguments and Declaration filed 4/30/2008 have been fully considered but they are not persuasive.** Applicant argues that '812 does not teach or fairly suggest adding a polyol to a culture medium before and/or during fermentation in a process of fermenting a bacterium specifically for producing an enzyme of interest and that the benefits of doing so would not be predictable. Applicants arguments are not persuasive because as stated above, it is noted that '812 teaches recovering a protein of interest from a fermentation broth (0044), they do however teach adding a polyol to a culture solution **prior to the recovery step**, i.e. during fermentation (0007,0009,0070). Clearly, if the art is teaching recovering a protein of interest from a fermentation broth prior to the recovery step, the addition of polyols before the recovery step can only be

occurring during fermentation. Applicant states in the arguments, p.6 first paragraph, that "One of ordinary skill in the art of making enzymes would understand that fermentation occurs before the recovery of enzyme." Thus, one of skill in the art would be motivated to add a polyol to a fermentation broth because polyols are known in the art to be useful in increasing solubility of a protein of interest (0007).

Claims 14-33 are rejected under 35 U.S.C. 103(a) as being unpatentable over the combination of Schreiber (U.S. Patent 4,016,039) in view of each of Brothers et al (U.S. Patent 4,673,647), GB 1001173 and Boyer et al (U.S. Patent 5,385,837).

Applicant claims a method for fermenting a bacterium, specifically *Bacillus* sp., producing an enzyme of interest, specifically a hydrolase, in a culture medium of at least 50 liters comprising adding one or more compounds in the amount of at least 0.1%(w/w) selected from 1,2-propandiol, 1,3-propandiol, ethylene glycol, trehalose, xylitol, arabitol, dulcitol, erythritol, sorbitol and a polyether having an average molecular weight less than 1000, either before and/or during fermentation. Applicant also claims addition of a salt to the medium, such as a chloride, sulphate, phosphate, nitrate, and ammonium salt. The enzyme of interest, a hydrolase, is recovered after removal of the bacterium.

Schreiber also disclose a process for the recovery of proteins, specifically proteases, from fermentation solutions containing polyoxyethylene glycol, i.e. polyethylene glycol, having a low molecular weight between 500-800 in the amount of up to 3% by weight and salts such as sulphate and chloride salts(see abstract and column 1, lines 10-13). The polyol is added "during" fermentation. Specifically,

Schreiber teaches adding the polyol to the fermenter solution before precipitation and filtration, i.e., during fermentation. They teach that the improvement is found in adding the polyol to the fermentation solution **before** adding an inorganic salt (see claim 1 and example 1), and **before** precipitation (see abstract).

Brothers et al disclose a process for the recovery of enzymes obtained from a fermentation medium from a microorganism of interest. Brothers differs from the claims in that, although they disclose any polyol and more specifically low molecular weight polyethylene glycol, 1-2,propandiol, and the C2 through C8 alcohols having at least two OH groups may also be used. Such polyols include propylene glycol, glycerol, the low molecular weight (900 or less) polyethylene glycols and mixtures thereof, therefore, sugar alcohols such as xylitol, arabitol, dulcitol, erythritol, and sorbitol, may be used during the enzyme preparation. They do not specifically state trehalose, xylitol, arabitol, dulcitol, erythritol, and sorbitol, however, xylitol, arabitol, dulcitol, erythritol, sorbitol and polyethers having an average molecular weight of less than 1000 meet the disclosed characteristics and would therefore be obvious to use such sugar alcohols. They teach adding a polyol solution, preferably low molecular weight polyethylene glycol, 1-2,propandiol, and the C2 through C8 alcohols having at least two OH groups. Such polyols include propylene glycol, glycerol, the low molecular weight (900 or less) polyethylene glycols and mixtures thereof (see column 5, lines 3-53) after fermentation to obtain the enzyme of interest. However, they teach these compounds to be important in obtaining an enzyme of interest in a fermented solution, thus it would be obvious to one of ordinary skill in the art to add these compounds to a fermented composition to

Art Unit: 1657

obtain a protein, i.e. enzyme during fermentation rather than "after" because these compounds are known in the art to be useful in recovering enzymes in a solution, i.e. solubilizing an enzyme of interest (col 4, lines 53-62). Thus, one of ordinary skill in the art at the time of the invention would have been motivated to use polyols disclosed in the art with a reasonable expectation of success in obtaining an enzyme of interest from a fermentation solution.

Further support of the use of carbohydrates and salts in a fermentation medium to obtain an enzyme of choice from a microorganism is disclosed by Boyer et al. They disclose obtaining an alkaline protease from *Bacillus proteolyticus* culture containing substrates such as trehalose (see Table 1) and salts such as potassium phosphate, calcium chloride, sodium sulphate and magnesium sulphate (see abstract and column 5, lines 65 continued to column 6, up to lines 56).

It is well established that duplicating compounds or components with similar functions within a composition is obvious; see *In re Harza*, 274F.2d 669, 124 USPQ 378 (CCPA 1960) and MPEP 2144.04. **Polyols, i.e. sugar alcohols were known in the art at the time of the invention to solubilize and recover enzymes (see Brothers et al. column 5, lines 20-27, Schreiber, abstract and col. 1, lines 10-13, GB1001173, and Boyer et al).**

It is well known that it is *prima facie* obvious to combine two or more ingredients each of which is taught by the prior art to be useful for the same purpose in order to form a third composition which is useful for the same purpose. The idea for combining them flows logically from their having been used individually in the prior art. *In re Pinten*,

Art Unit: 1657

459 F.2d 1053, 173 USPQ 801 (CCPA 1972); *In re Susi*, 58 CCPA 1074, 1079-80; 440 F.2d 442, 445; 169 USPQ 423, 426 (1971); *In re Crockett*, 47 CCPA 1018, 1020-21; 279 F.2d 274, 276-277; 126 USPQ 186, 188 (1960).

One of ordinary skill in the art would therefore have been motivated by the combined disclosures of the references of the addition of many carbohydrates i.e. polyols and sugar alcohols to fermentation mediums during and after fermentation to obtain an enzyme of interest, more specifically the addition of claimed polyols, which are disclosed as being acceptable and successful in obtaining enzymes from fermentation solutions.

Therefore, the claimed invention as a whole is prima facie obvious over the prior art.

**Applicant's arguments and Declaration filed 4/30/2008 have been fully considered but they are not persuasive.** Applicant argues that neither reference teaches or suggests adding the claimed polyols to a culture medium before and/or during fermentation in a process of fermenting an enzyme of interest, however, Schreiber and GB'173 do teach and suggest adding a polyol/carbohydrate to a fermentation medium during fermentation to obtain an enzyme of interest. Clearly, if the art is teaching recovering a protein of interest from a fermentation broth prior to the recovery step, the addition of polyols before the recovery step can only be occurring during fermentation. Further, although Brothers also suggests adding a polyol to the medium after fermentation, these compounds are known in the art to be useful in a fermentation medium to obtain an enzyme of interest, thus one of ordinary skill in the art

would expect success in adding such a polyol to a fermentation solution/culture medium before and/or during the fermentation process to obtain an enzyme of interest.

***Conclusion***

**NO claims are allowed.**

**THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to **TIFFANY M. GOUGH** whose telephone number is (571)272-0697. The examiner can normally be reached on **M-F 8-5 pm**.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jon Weber can be reached on 571-272-0925. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
